

Converde, an agriculture pioneer with focus on sustainable and breakthrough technologies, is pleased to introduce PURE - the most advanced line of fertilizers available today.

Created utilizing a patented technology, PURE is fixated with natural nitrogen and carbon dioxide gas molecules at the highest levels ever achieved, and combined with a proprietary blend of organic nutrients, resulting in the world's only complete chemical free fertilizer.

The most complete chemical free liquid fertilizer in existence.

Fertilizer that decreases plant surface tension and increases absorption

Dry chemicals remain the single most used input to increase crop yields, however, when these applications, such as granulated UREA, dissolve in water, it is estimated that the root system only absorbs 10-20% of the total inputs and the remainder becomes runoff. As a consequence, chemical fertilizers destroy soil, drains into the water table and produces less nutritious crops.

Unprecedented nitrogen levels, zero chemicals

The natural nitrogen and carbon dioxide gas fixation process of PURE lowers the surface tension of the liquid fertilizer, allowing root systems to absorb the majority of the organic nutrients, reducing the total application requirements. Additionally, PURE dramatically increases yields and crop quality, while eliminating chemical runoff entirely.

PURE revolutionizes agriculture and sets the highest standard in fertilizer performance.
